I'm # Bryan Kinnear

I've been a ## Front End Software Engineer

since 2014. I'm interested in building and maintaining fantastic web applications. Staying current with all the goodies that the newest specs of ECMAScript, HTML and modern JS frameworks contain is my cup of tea. When I'm not tucked away in a code base you can probably find me riding my bike, eating out at some new restaurant or rapidly consuming a Netflix, Hulu, HBO or *insert random streaming content service* show.

SKILLS

Javascript

Ember.js

Mocha/Chai/Qunit

Bash

Kanban

Functional Programming

Agile/Scrum

Effective Communication

API Design

ECMAScript

HTML

CSS/SCSS

Ruby

French Pressing

Spinning Wheels on Bicycles

EXPERIENCE

2014-2015

Galvanize (gSchool)

Learned the ins and outs of writing web applications, both front and back end. During this 6 month, 40 hour/week school I learned the basics of writing software, accompanying tests and how the world of software works. I left top of my class and had a position with my first company before the class graduated.

2015-2017

Digabit

Responsible for translating an Actionscript Flex application for OEMs into a modern web framework (Ember.js). Here I helped design API, Write thoroughly tested features (Mocha + Chai was our testing framework) and influence the UI/UX and Design Decisions through planning sessions.

For 2 weeks at a time, in a cycle, I was responsible for responding to any and all issues with our application that arose (e.g. outages caused by data center issues, customers overloading a scheduler or indexer service and being responsible for helping make sure deploys went smoothly).

SO, WHAT DO I BRING TO THE TABLE?

I'm a detail oriented kind of person who works well with teams or solo and has experience working with large companies like Apple and small startups. If all that sounds great please see my contact information at the top of the page!
